Creating an eFinder or ScopeDog SD card

Download and open the Raspberry Pi Imager App for your PC or MAC
https://www.raspberrypi.com/software/

Insert your SD card into the computer via a suitable adapter if needed.

On the first screen select the three options, Your Pi model, Bookworm 64bit & your SD card. It should look like …
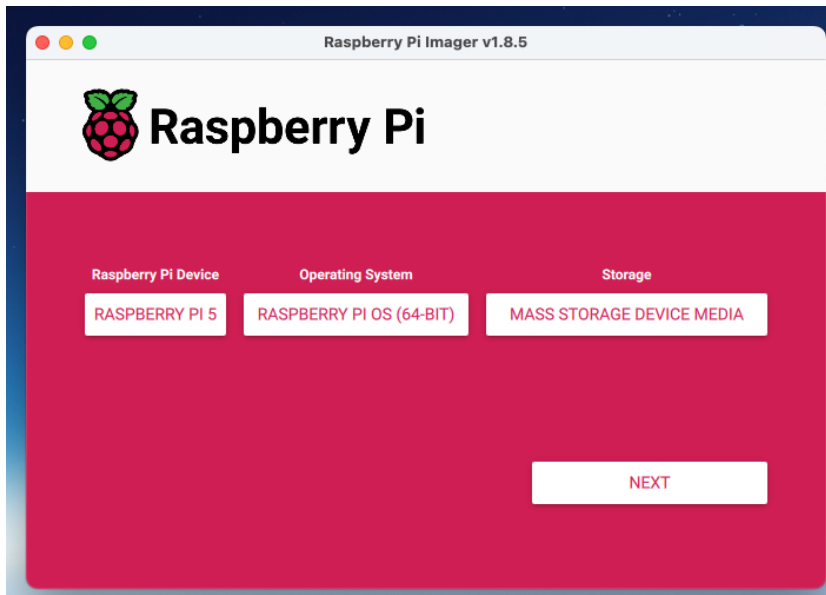

Click NEXT and you will get this …

Select 'EDIT SETTINGS' and complete the options …

For eFinder hostname is 'efinder', username 'efinder', password your choice.

For ScopeDog hostname is 'scopedogmk3', username 'scopedog', password your choice.

Note it is important that these are all lowercase.

You probably best not set the wireless LAN if you want to set up a hotspot later. Or if you do, when later setting up the hotspot, delete the LAN connection else your Pi will connect to your LAN rather than generate a hotspot (unless you are good at setting network priorities!)

Click SAVE and you will be back to …
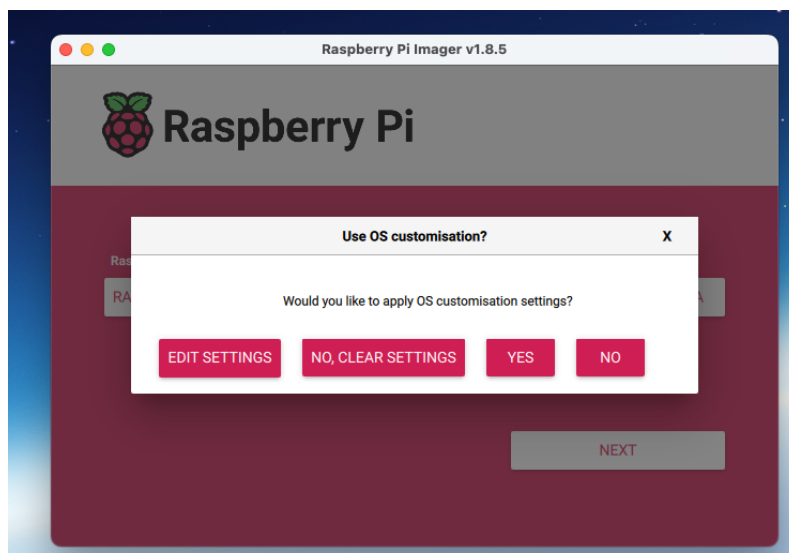

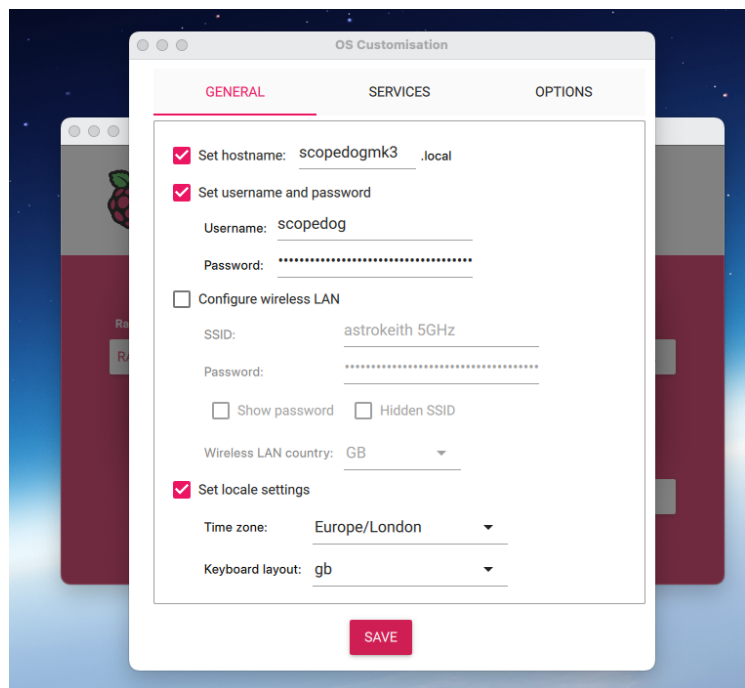

This time select YES and YES again and maybe enter your PC password and your SD card will be ready in about 10 minutes.

Now install the code using the process desribed in the separate notes, 'eFinder (or ScopeDog) install on 64bit Raspian OS 'Bookworm' for Pi4 & 5'
